Ranking Journals Impact Factor 2011

The impact factor (IF) or journal impact factor (JIF) of an academic journal is a measure reflecting the yearly average number of citations to recent articles published in that journal. It is frequently used as a proxy for the relative importance of a journal within its field; journals with higher impact factors are often deemed to be more important than those with lower ones.

Impact factor - Wikipedia

In Table 11.1, the first column, 'Importance of journals (%)', describes the proportion of references within ISI-indexed journals which refer to other journals (). The data set consists of the references of original articles and reviews published in the ISI indexes during 2002, with only references to items from 1980 onwards being considered.

John Hattie developed a way of synthesizing various influences in different meta-analyses according to their effect size (Cohen's d). In his ground-breaking study "Visible Learning" he ranked 138 influences that are related to learning outcomes from very positive effects to very negative effects. Hattie found that the average effect size of all the interventions he studied was 0.40.
