Sandpaper Friction Experiments Secondary Evidence - Yeah, reviewing a books sandpaper friction experiments secondary evidence could build up your close connections listings. This is just one of the solutions for you to be successful. As understood, skill does not suggest that you have astonishing points.

Comprehending as well as contract even more than other will find the money for each success. next to, the declaration as without difficulty as perspicacity of this sandpaper friction experiments secondary evidence can be taken as capably as picked to act.

Static Friction Experiment. When an object isn't moving, it has static friction. It will take a certain amount of force to get the object moving. The amount of force it will take depends on the surfaces and the weight of the object, among other factors. To test how much force is needed to overcome static friction,...

- A block of 2 x 4 four inches long with a hook in one end or a bent nail to drag with the spring scale.
- A spring scale that measures small forces and has hooks on both ends. 0 to 250 grams is a good choice.
- Two (or more) 12-inch strips of widely variant grits of sandpaper, taped to a table or other surface.

Observations. The strongest evidence for this can be found in the results for the towel and the sandpaper. The towel was the most textured surface and it had the shortest roll. It only rolled an average of 195.6 inches, which was 73.4 inches less than the sandpaper roll and 114.4 inches less than the paper towel roll.

Icy Roads Ahead—Put On Your Chains. Putting chains on car tires increases the resistance between the tires and the road allowing the car to "grip" the road. This resistance to sliding is called friction. In this experiment, you will be investigating how to increase and decrease the friction between two surfaces.

Questions About Physics. As the sandpaper got to a certain roughness the grains of sand were larger which decreased the overall contact area and reduced the friction. The grains are larger so there will be fewer contact points. One example of this is when you wear cleats on a smooth hard surface you slip all over the place.

Friction is a force between objects that opposes the relative motion of the objects. In this project, you will be studying kinetic friction (also called sliding friction). When two objects are moving relative to one another, kinetic friction converts some of the kinetic energy of that motion into heat.
