vformat (format\_string, args, kwargs) ¶. This function does the actual work of formatting. It is exposed as a separate function for cases where you want to pass in a predefined dictionary of arguments, rather than unpacking and repacking the dictionary as individual arguments using the \*args and \*\*kwargs syntax. vformat() does the work of breaking up the format string into character data and ...

Creating and Using Templates¶. As explained in the previous article, controllers are responsible for handling each request that comes into a Symfony application and they usually end up rendering a template to generate the response contents.. In reality, the controller delegates most of the heavy work to other places so that code can be tested and reused.
