A relational database is a digital database based on the relational model of data, as proposed by E. F. Codd in 1970. A software system used to maintain relational databases is a relational database management system (RDBMS). Virtually all relational database systems use SQL (Structured Query Language) for querying and maintaining the database.

Modeling these out in a relational database would result in a huge ERD with lots of tiny tables hiding the core concepts and relations of the model. So here comes the hybrid model: let's store relational data in a relational database and add 'document' structures to it for the document oriented data. Best of both worlds!
